

#Question 1:

#For every market date, display customers who made at least 1 purchase

```
select distinct market_date, customer_id
from `farmers_market.customer_purchases`
order by 1,2
```

```
select market_date, customer_id
from `farmers_market.customer_purchases`
group by market_date, customer_id
order by 1,2
```

#Question 2:

#Identify vendors who brought at least 2 products to the farmer's market between the period from 2019-05-02 to 2019-05-16. For the above vendors also identify the total quantity and average price

```
select vendor_id, count(distinct product_id) as product_count, sum(quantity) as
total_quantity, avg(original_price) as avg_price from
`farmers_market.vendor_inventory`
where market_date between '2019-05-02' and '2019-05-16' group by
vendor_id
having product_count > 2
```

#Question 3:

#Get a list of zip codes for customers who made a purchase on 2019-04-06.

```
-- join
select distinct c.customer_zip
from `farmers_market.customer` as c
inner join `farmers_market.customer_purchases` cp on
c.customer_id = cp.customer_id
where cp.market_date = '2019-04-06'
```

--sub-query

```
select
distinct customer_zip
from `farmers_market.customer`
where customer_id in
(select distinct customer_id
from `farmers_market.customer_purchases`
where market_date = '2019-04-06')
```

#Question 4

#Display full names of customers and the total amount they have spent on every order. Include customers who have not made any purchases

```

select c.customer_id ,c.customer_first_name,
c.customer_last_name,
cp.quantity * cp.cost_to_customer_per_qty as total_amount from
`farmers_market.customer` c
left join `farmers_market.customer_purchases` cp
using(customer_id)

```

#Question 5:

#Find all vendors (including those who never got a booth assigned) and show how many times each was assigned a booth.

If a vendor was never assigned a booth, show 0 as the count.

Use the vendor and vendor_booth_assignments tables.

```

select
    v.vendor_name,
    count(vba.booth_number) AS total_assignments
from `farmers_market.vendor` as v
left join `farmers_market.vendor_booth_assignment` as vba
    on v.vendor_id = vba.vendor_id
group by v.vendor_name
order by total_assignments DESC;

```

#Question 6:

#List the average purchase amount for each customer, categorizing them as "Low spender", "Medium spender", or "High spender":

#Define "Low spender" as those with an average purchase below \$7, "Medium spender" between \$7 and \$10, and "High spender" above \$10.

-- extra task: customer full name also in the output

```

select c.customer_id, c.customer_first_name,
round(avg(quantity * cost_to_customer_per_qty),2) avg_amount, case
when avg(quantity * cost_to_customer_per_qty) < 7 then 'Low Spender'
when avg(quantity * cost_to_customer_per_qty) between 7 and 10 then 'Medium Spender'
else 'High Spender'
end as spend_category
from `farmers_market.customer_purchases` cp
join `farmers_market.customer` c
on cp.customer_id = c.customer_id
group by customer_id, customer_first_name

```

#Question 7:

#Find all products that were never purchased by any customer.

```
select
product_id
from `farmers_market.product`
where product_id not in (select distinct product_id from
`farmers_market.customer_purchases`)
```
